

Click on this and get a photo essay about the family that lives here (click on another picture in the column and get an essay about someone else with the same level of measured income. (a rural household could have the same income and the pictures would be really different. Column height (number of boxes) is in proportion to the true % of people who are at that level of income. The number of boxes in a column would be in proportion to how many are in rural areas, or states. So 5 of these 7 boxes (at this level of income) would be rural.

Could do something like: Here is the poverty line. Let's look at someone just to the left (poor) and to the right (not-poor) and show them to be indistinguishable (in the same city or in a comparable rural area).
